Senior Automation QA Technical Task

You will be provided with a ZIP archive containing the **Analytics** application.
The archive includes:

- requirements.md — application requirements and expected behavior;
- README.md — instructions for installing and running the application.

Task

Create a small automated test project using:

- Java
- Maven
- Cucumber
- Playwright

Requirements

1. Review the application requirements and functionality and choose **one valuable UI scenario and one valuable API scenario** to automate.
2. Implement exactly:
   - **1 UI automated test** using Playwright;
   - **1 API automated test** using the backend endpoint used by the application.
3. Use Cucumber for test scenarios and step definitions.
4. Structure the test framework so that additional UI and API tests can be added easily in the future.
5. Provide clear instructions for how to install any required dependencies and run the automated tests.

Note: The goal of this task is **not to automate all application requirements or create a large number of test cases**. We are primarily interested in seeing how you design and structure the automation framework, organise UI and API testing, implement the selected scenarios, and make the solution maintainable and extensible.
